2. Citations and explanations (Rule 70.7):

see separate sheet

#### Box No. VIII Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:

see separate sheet

PCT/EP2004/003933

#### Re Item V

Reasoned statement with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

#### 1. Subject-matter

Subject-matter of claims 1 - 13 of the present application is a method for discontinuously metering a solid catalyst (or another process auxiliary) into a fluidized bed reaction zone in a region where a fluid stream (nitrogen, propane) is in each case introduced, so that a region having a reduced particle density is formed in the fluidized bed around the metering point and the catalyst (or the other process auxiliary) is metered at this point. Preferably, the metering point is at a distance of at least one centimeter from the reactor wall.

In one embodiment the fluid stream is introduces concentrically around the metering point for the catalyst (or the other process auxiliary).

This way, the catalyst is carried far away from the reactor wall into the fluidized bed and is distributed well, so that reactor fouling is avoided.

Subject-matter of claim 14 of the present application is a continuous polymerization process wherein the catalyst (or the other process auxiliary) is introduced according to the previous claims.

Subject-matter of claims 15 - 17 of the present application is an apparatus for carrying out the previously described process.

#### 2. Technical Problem

The problem was to provide a process wherein reactor fouling is avoided. This aim can be achieved by the claimed process, wherein the freshly added catalyst is taken sufficiently far away from the reactor wall by a surrounding fluid stream of inert gas, so that no hot spots will adhere to the reactor wall.

### 3. Reference is made to the following documents:

D1: EP 0 226 935 (cited in the application)
D2: EP 0 811 637 (cited in the application)

D3: WO 02/38629 D4: US 6,088,934 4. The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claims 15 - 17 is not new in the sense of Article 33(2) PCT. Subject-matter of claims 15 - 17 is mainly a valve unit for introducing portions of a catalyst and/or process auxiliary into a fluidized bed reactor.

Moreover the claims comprise a fluidized bed reactor, a reservoir unit, a portioning unit and feed lines, which are obvious features to carry out the claimed process.

D4 discloses a nozzle for injecting a liquid directly into a fluidized bed.

The used device appears suitable also for the process of the present application.

Therefore, novelty can not be acknowledged to the subject-matter of present claims 15 - 17 in view of D3.

5. The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of **claims 1 - 14 and 15 - 17** does not involve an inventive step in the sense of Article 33(3) PCT.

**D1** is considered the closest prior art discloses a metering device for introducing a solid powder into pressured vessels, specially a free flowing catalyst powder into a reactor (see col. 2, line 26 to col. 3, line 13 and claims).

Distinguishing feature between the teaching of D1 and the present application is that D1 does not disclose any feature which would avoid that the catalyst comes directly after injection in contact with the reactor wall.

Therefore, the objective technical problem was to modify process according to D1 in such a way, that contact of the freshly introduced catalyst with the reactor wall is avoided.

**D2**, however, discloses a method for injecting a liquid (not a solid) unsupported catalyst into the reaction zone of a fluidized bed reactor.

In a particularly preferred embodiment of D2, the liquid catalyst in the carrier gas is surrounded by at least two gases, the first gas serving primarily to deflect resin particles of the bed out of the path of the liquid catalyst and the second gas primarily prevents the injection tube or nozzle tip from getting clogged. As used in this application, when the liquid catalyst in the carrier gas is surrounded by two gases, the catalyst is considered to be shrouded.

D3 discloses a gas phase polymerization process wherein cooled recycle gas is

#### INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY (SEPARATE SHEET)

International application No.

PCT/EP2004/003933

introduced together with the catalyst into the reactor by means of a plenum, wherein the catalyst is surrounded by at least two gasses, the first gas (preferably flowing through the plenum) serving to deflect resin particles of the bed out of the path of the catalyst and the second gas (preferably flowing through the support tube) primarily prevents the injection tube or nozzle tip from getting clogged (see § 0008 - §0018). The catalyst may also be present in powder form (see §0099).

Therefore, it was obvious to the skilled person to modify the process and the device according to D1 in such a way, as it is disclosed in D2 and D3, in order to arrive at a process, wherein the introduced catalyst is protected by inert gases and does not come in contact with the reactor wall.

Therefore, an inventive step can not be acknowledged to the subject-matter of present claims 1 - 14 and 15 - 17.

6. Since the gas phase polymerization of olefins is an important industrial process, industrial applicability can be acknowledged.

#### Re Item VIII

### Certain observations on the international application

The application does not meet the requirements of Article 6 PCT, because claim 9 is not clear.

According to claim 9, the fluid stream is formed by one or more inert gases from the group consisting of  $C_2$ - $C_3$ -alkenes and  $N_2$ . However,  $C_2$ - $C_3$ -alkenes are not considered as inert gases but as monomers.

Applicant's attention is drawn to the fact that the application may not be amended in such a way that its content extends beyond the content of the application as filed (Article 19(2) PCT).
